

QuarkNet

MINERvA Masterclass (Abbreviated)

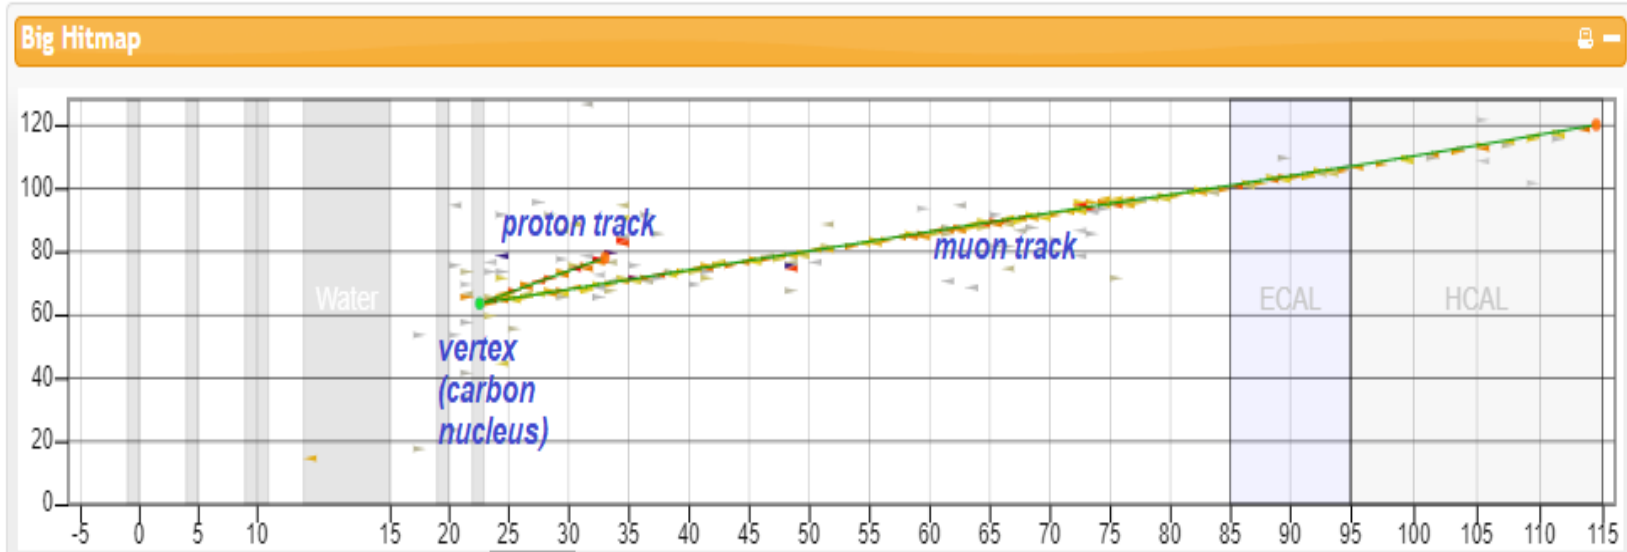

QuarkNet

The MINERvA Detector

A muon neutrino interacts with a carbon nucleus. The interaction results in a muon and a proton that are ejected from the nucleus. **What happens to the momentum initially carried by the muon neutrino?**

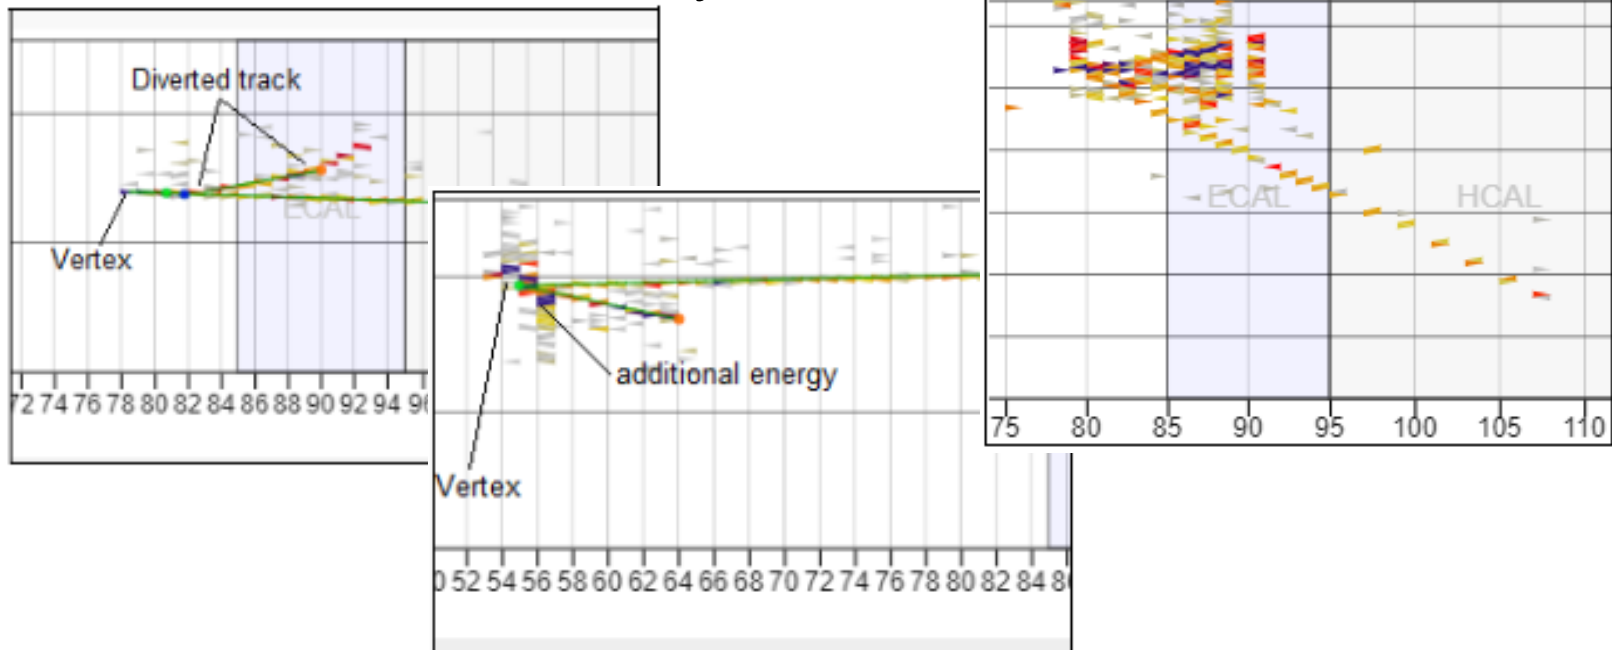

Neutrino (no track) → **proton + muon**

MINERvA can measure the momentum of both the proton and muon.

Background events:

- Do not fit signal paradigm of one short proton track, one long muon track, or
- Confound the ability of MINERvA to measure momentum accurately.

QuarkNet

Signal vs. Background

Big Hitmap

Big Hitmap

One of these is signal, one is background. Which is which? Why?

Conservation of Momentum

Initial momentum:

- p_y all in z (beam) direction

Final momentum:

- $p_z = p_{zp} + p_{z\mu}$
- $p_x = p_{xp} + p_{x\mu}$
- $p_y = p_{yp} + p_{y\mu}$

QuarkNet

What will we investigate?

- If we measure final p_x , p_y , and p_z for many events in MINERvA, what do we get? Why?
- What does this imply?
