

# QuarkNet Data Workshop

August 12, 2015

Feynman Diagrams:

Introduction and  
Activities

Celing cat is observing you accelerate.

First some useful material to introduce  
particle physics

# Inside the atom

If the protons and neutrons in this picture were 10 cm across, then the quarks and electrons would be less than 0.1 mm in size and the entire atom would be about 10 km across.

# For a discussion of statistics, discoveries in physics

Combined results: consistency of the data with the background-only expectation and significance of the excess

Excellent consistency (better than  $2\sigma$ !) of the data with the  $b$  hypothesis over full mass spectrum

CERN, July 4, 2012.

The Standard Model Lagrangian  
 (useful only to show that the Standard Model is  
 described entirely by one equation)

$$\begin{aligned}
 \mathcal{L}_{GWS} = & \sum_f (\bar{\Psi}_f (i\gamma^\mu \partial_\mu - m_f) \Psi_f - e Q_f \bar{\Psi}_f \gamma^\mu \Psi_f A_\mu) + \\
 & + \frac{g}{\sqrt{2}} \sum_i (\bar{a}_L^i \gamma^\mu b_L^i W_\mu^+ + \bar{b}_L^i \gamma^\mu a_L^i W_\mu^-) + \frac{g}{2c_w} \sum_f \bar{\Psi}_f \gamma^\mu (I_f^3 - 2s_w^2 Q_f - I_f^3 \gamma_5) \Psi_f Z_\mu + \\
 & - \frac{1}{4} |\partial_\mu A_\nu - \partial_\nu A_\mu - ie(W_\mu^- W_\nu^+ - W_\mu^+ W_\nu^-)|^2 - \frac{1}{2} |\partial_\mu W_\nu^+ - \partial_\nu W_\mu^+ + \\
 & -ie(W_\mu^+ A_\nu - W_\nu^+ A_\mu) + ig' c_w (W_\mu^+ Z_\nu - W_\nu^+ Z_\mu)|^2 + \\
 & - \frac{1}{4} |\partial_\mu Z_\nu - \partial_\nu Z_\mu + ig' c_w (W_\mu^- W_\nu^+ - W_\mu^+ W_\nu^-)|^2 + \\
 & - \frac{1}{2} M_\eta^2 \eta^2 - \frac{g M_\eta^2}{8 M_W} \eta^3 - \frac{g'^2 M_\eta^2}{32 M_W} \eta^4 + |M_W W_\mu^+ + \frac{g}{2} \eta W_\mu^+|^2 + \\
 & + \frac{1}{2} |\partial_\mu \eta + i M_Z Z_\mu + \frac{ig}{2c_w} \eta Z_\mu|^2 - \sum_f \frac{g}{2} \frac{m_f}{M_W} \bar{\Psi}_f \Psi_f \eta
 \end{aligned}$$

If you consider the amazing variety of living and nonliving things, you can't help but be in awe of the fact that everything you have ever seen, smelled, and heard - people, birds, flowers; the clouds in the sky, and the moon and stars above; earth, wind, fire, and water - is ultimately described by a single beautiful equation.

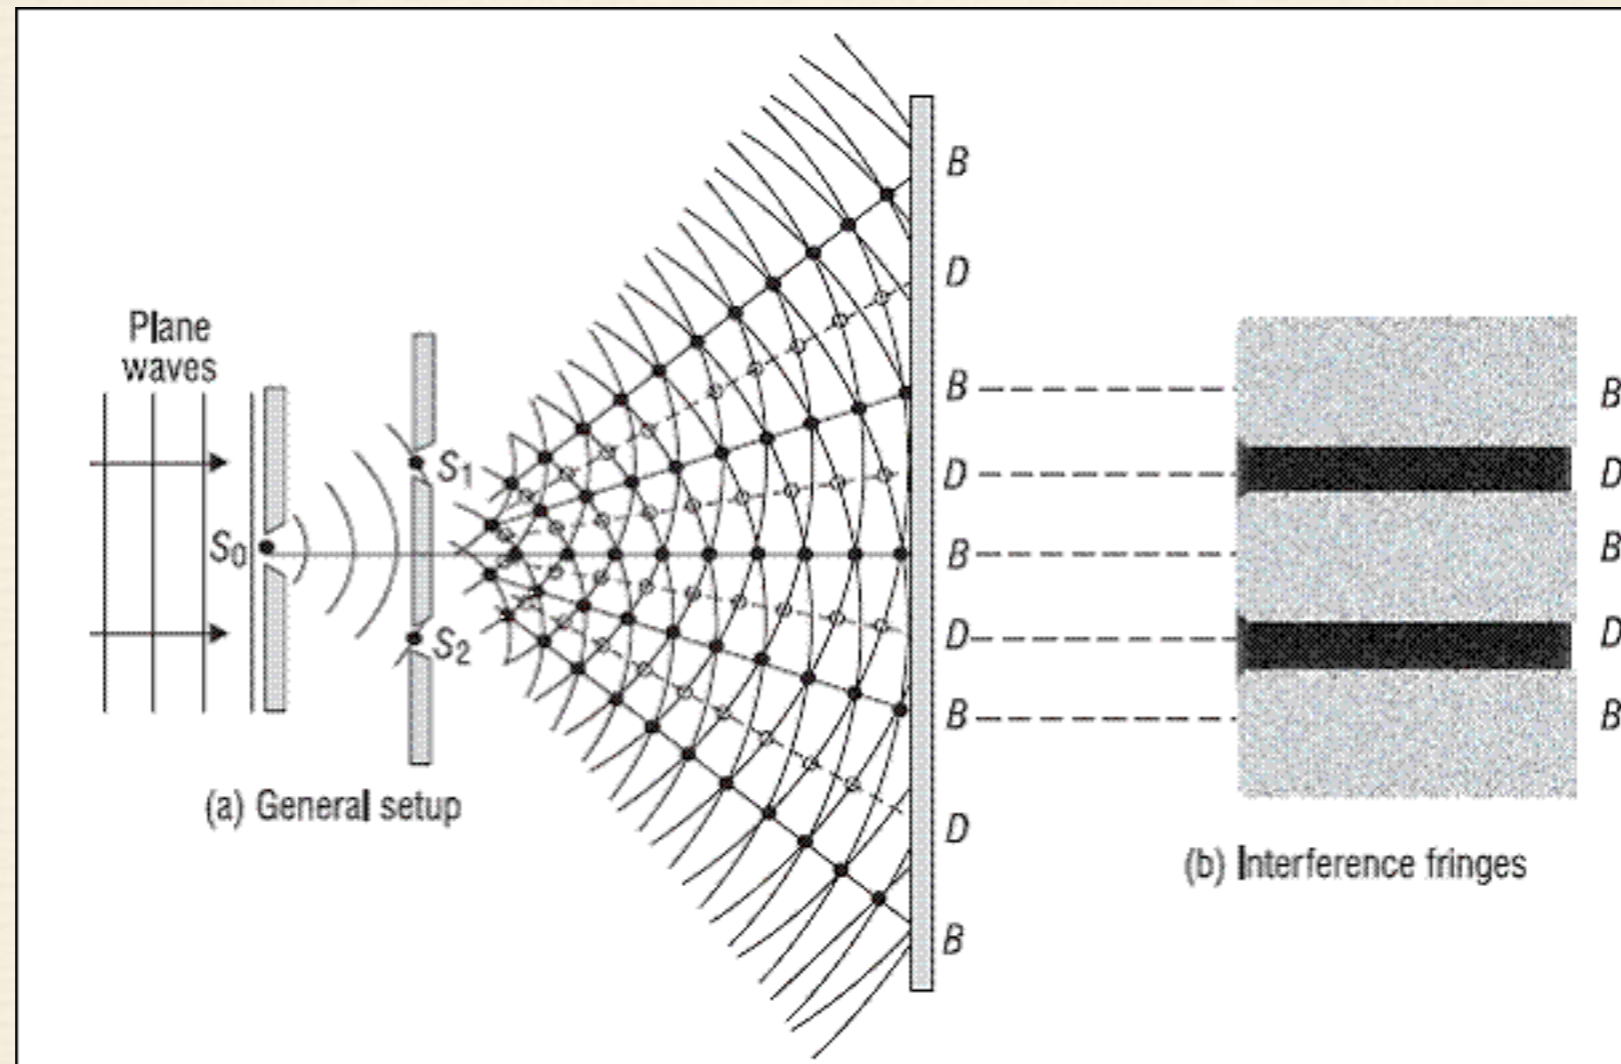

# The Standard Model

Feynman rules organize calculations of probabilities for initial states to evolve into specified final states.

They also determine what types of interactions are allowed, and which are forbidden in the Standard Model.

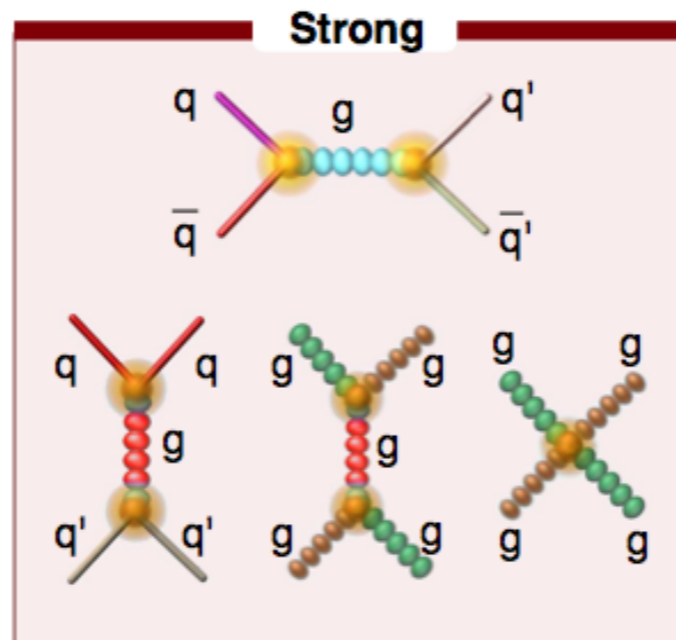

# How did Feynman think about quantum mechanics?

Now add more slits.

# Types of Particle Interactions

Range  $\sim 10^{-15}$  m, relative strength = 1

# Feynman Vertices

## Standard Model Interactions (Forces Mediated by Gauge Bosons)

X is any fermion in the Standard Model.

X is electrically charged.

X is any quark.

U is a up-type quark;  
D is a down-type quark.

L is a lepton and  $\nu$  is the corresponding neutrino.

X is a photon or Z-boson.

X and Y are any two electroweak bosons such that charge is conserved.

# The Standard Model

## Rules:

1. Arrows that follow the direction of time are particles; arrows that oppose the direction of time are antiparticles.
2. Lines of similar type can be connected to one another, with arrows flowing continuously.
3. Loops are okay.
4. Energy and momentum are conserved (so light things can't decay into heavier things, even if there's a Feynman diagram for such a process).

# The Standard Model

Standard Model Interactions  
(Forces Mediated by Gauge Bosons)

X is any fermion in the Standard Model.

X is electrically charged.

X is any quark.

U is a up-type quark;  
D is a down-type quark.

L is a lepton and  $\nu$  is the corresponding neutrino.

X is a photon or Z-boson.

X and Y are any two electroweak bosons such that charge is conserved.

## Activity:

Draw a bunch of Feynman diagrams, and describe the particles in the initial and final states.

## Questions (after the activity):

1. What particle properties are conserved (necessarily the same before and after an interaction)?

2. How are the weak interactions and the strong interactions different than the electromagnetic interaction?

# Electron Scattering

## Standard Model Interactions (Forces Mediated by Gauge Bosons)

X is any fermion in the Standard Model.

X is electrically charged.

X is any quark.

U is a up-type quark;  
D is a down-type quark.

L is a lepton and  $\nu$  is the corresponding neutrino.

X is a photon or Z-boson.

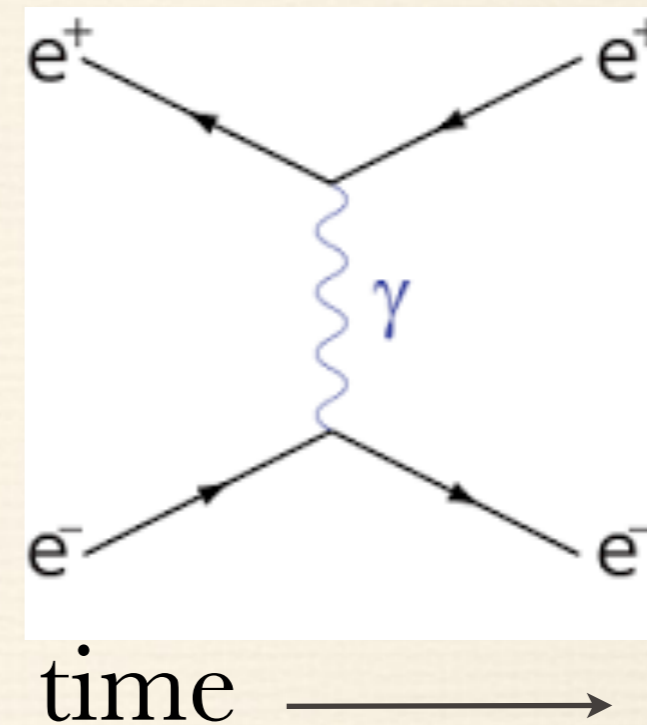

X and Y are any two electroweak bosons such that charge is conserved.

time  $\longrightarrow$

# Electron-Positron Scattering

total electric charge = conserved  
 #leptons - #antileptons = conserved

# Activity: Interactions and the Direction of Time

## Activity:

- 1) Draw a Feynman diagram representing scattering of electrons. Label the direction of time with an arrow near the Feynman diagram.
- 2) Draw the same Feynman diagram again, but this time reverse the direction of time, indicated with an arrow pointing opposite the direction of the original arrow. What interaction does this correspond to?
- 3) Repeat with the two other orientations of time relative to the Feynman diagram.

## Discuss:

- 1) How are the various processes described by the same Feynman diagram related to one another?

**Note:** There are many ways to skin a cat!

# Neutron Beta Decay

Standard Model Interactions  
(Forces Mediated by Gauge Bosons)

X is any fermion in the Standard Model.

X is electrically charged.

X is any quark.

U is a up-type quark;  
D is a down-type quark.

L is a lepton and  $\nu$  is the corresponding neutrino.

X is a photon or Z-boson.

X and Y are any two electroweak bosons such that charge is conserved.

- total electric charge = conserved
- #leptons - #antileptons = conserved
- #quarks - #antiquarks = conserved

**Activity:** List a number of interactions that may or may not be possible.

For interactions that are not possible, why not? What conservation rules are violated?

For interactions that are possible, draw a Feynman diagram for that interaction.

Can a pion (or Kaon) decay to a muon and neutrino?  
If so, draw a Feynman diagram for that process.

Pion decay

Kaon decay
